STATEMENT OF VALUES

A COLLABORATIVELY WRITTEN STATEMENT OF VALUES FOR THE TVS SC

JUNE 2020

The goal of the LSST TVS SC is to advance our understanding of the Universe through science and to create and sustain a research environment in which all members can thrive. Supporting an equitable space free of discrimination is first and foremost a matter of social justice. We recognize that academia is embedded within, and takes advantage of, systemic racism that perpetuate white supremacy and suppresses non-white voices and voices of diverse scholars along other axes or privilege. We, as an organization, renew our commitment to be proactive in order to fix and stop this “status quo” in our corner of the Universe. The TVS SC is inherently a multinational organization with members from a wide range of cultures and this diversity strengthens our research by bringing in different perspectives and expertise. We seek to enhance our diversity of membership and to create an educational and research culture that is welcoming and supportive for all members. We encourage people to apply and be an active part of TVS, regardless of their race, color, country of origin, sex, age, national origin, religion, sexual orientation, gender identity and/or expression, disability or veteran status. We have an ongoing commitment to a range of initiatives to make our organization more equitable and justice, undertaken with the guidance of the Justice, Equity, Diversity, and Inclusion (JEDI) group of the TVS SC. More information on these activities can be found in our [TVS call to action](#). The leadership of the TVS SC and JEDI are responsible for, and all members are empowered to, ensuring full support for these activities. Accountability metrics are explicitly included in the same document.

MAF TF

Metrics (MAFs) were not generally available with the submitted TVS white papers and without them the cadences cannot be evaluated. This means the requested cadences may actually not be simulated, unless a MAF is provided or easily generated by the project members. This TF should

- 1 - Learn the MAF
- 2 - Review the TVS White Paper submissions for cadence proposals
- 3 - Design and code MAFs for all TVS submissions
- 4 - Create TVS specific (video) tutorials for MAF

SCIENCE PLATFORM EVALUATION THROUGH "STACK CLUB" INVOLVEMENT TF

Members will get involved in the LSST "stack club" and this gain access to the LSST Science Platform. This TF should:

- 1 - Gain familiarity with the LSST Science Platform and share it with the rest of TVS,
- 2 - Understand what TVS users need from the Science Platform and evaluate whether the current design will provide it.
- 3 - Report on Stack Club by a member of the club (possibly also member of TVS)

DEEP AND ACCURATE PSF PHOTOMETRY IN CROWDED FIELDS, AND SEARCH FOR VARIABLE STARS TF

This TF will follow the success of the deblending TF that

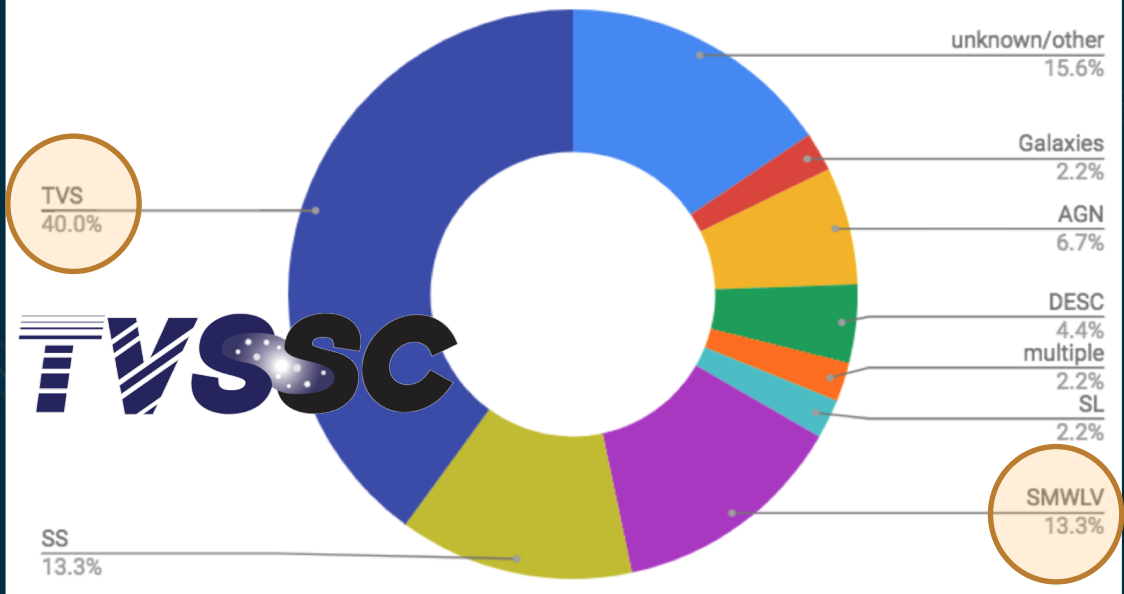

COMMISSIONING TF

The LSST commissioning is planned to start in a year and LSST Project has solicited the involvement of the SCs. This TF should:

Quote

Hi all - this is to let you know that SMWLV and TVS will be re-starting the informal “hack days” throughout 2021 Summer, to provide a space for people to work on various necessary projects, including (but not limited to) ongoing cadence investigations.

These will be much more loosely themed than the cadence hack days that led up to the Apr 15th SCOC cadence notes deadline: in addition to the gathertown space itself that is maintained by the project, a sign-up sheet will usually be posted for folks to claim a “room”. Occasionally there may be informal short presentations. All are welcome to the hack sessions: to enter the meeting space, click on [this Gathertown link](#).

The hack days will run from 10:00am-12:00 Noon EDT and 1300-1500 EDT unless otherwise stated on the following Thursdays ([click here to subscribe to the hack day Google calendar](#) ³). As always, please feel free to attend as much or as little as you find useful.

- Thurs May 13
- Thurs May 27
- Thurs Jun 10
- Thurs Jun 24
- Thurs Jul 08
- Thurs Jul 22
- Thurs Aug 05
- Thurs Aug 19
- Thurs Sep 02

Here is the plan of the meeting space:

talk

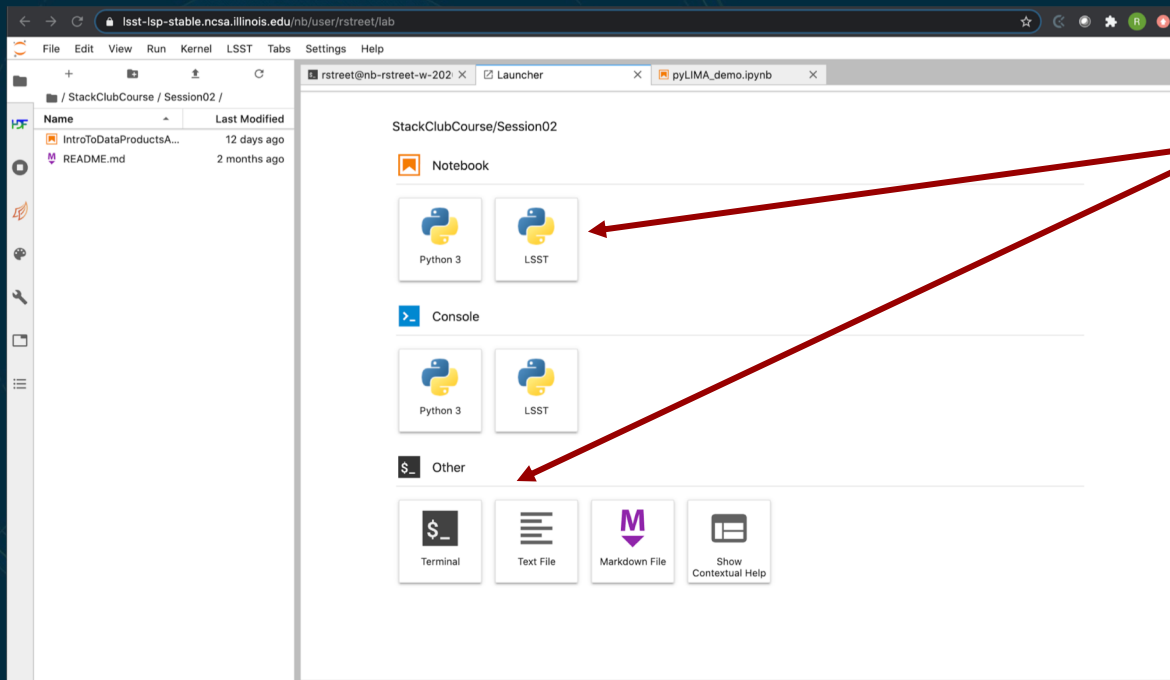

Lightcurve analysis

Much of TVS science will depend on analysing and modeling lightcurves
Extensive software already exists for this purpose

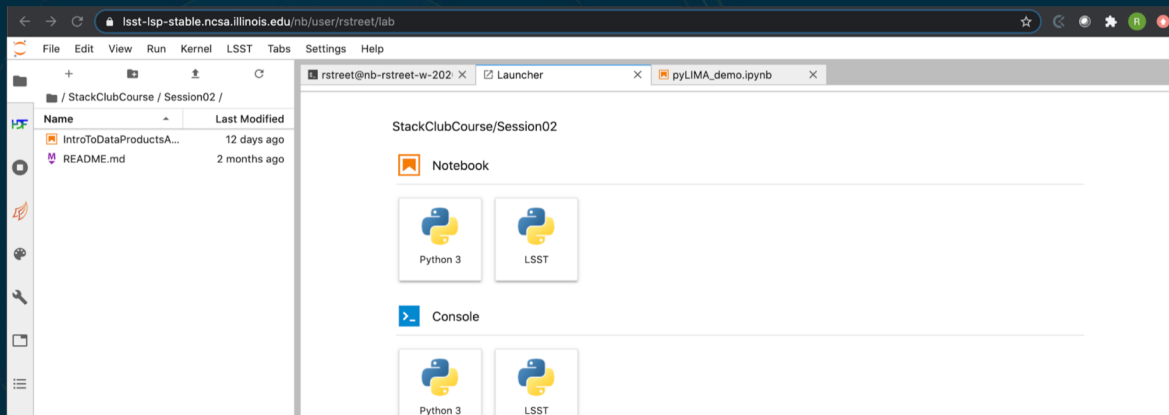

Graphics: Lightcurve.org, Maxted et al., 2004, MNRAS, 355, 1143, Khan, R. et al. (2010), ApJ, 726, 106

Lightcurve modeling in the RSP

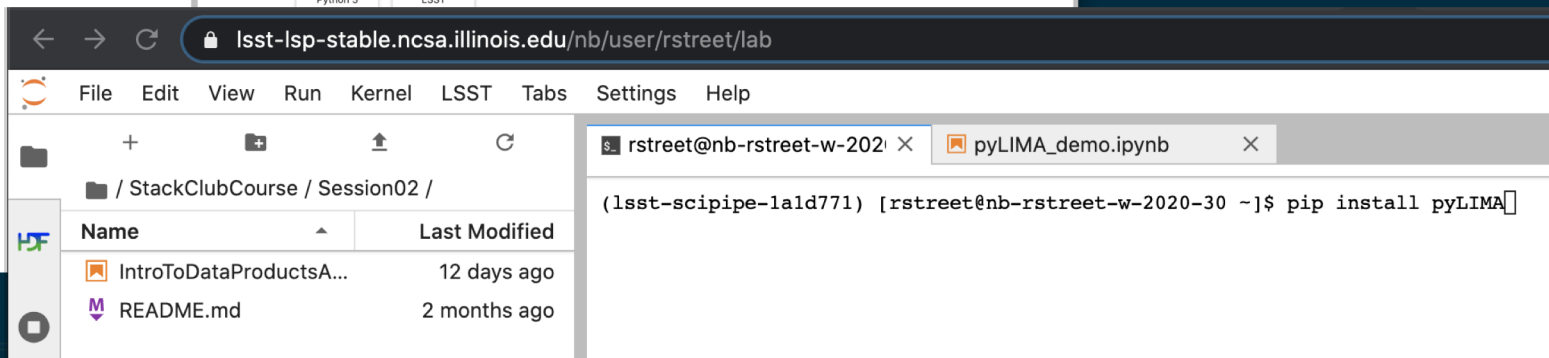

Notebook aspect of RSP offers both Jupyter Notebook and a terminal

Lightcurve modeling in the RSP

User accounts provide 100GB of storage and a virtual python environment where users can install their own software, e.g. via pip or clone from Github

Building lightcurves

```
mjds = []
mags = []
merrs = []
for visit in visit_list:
    data_id = {'visit':visit, 'ccdnum':9}

    exposure = butler.get('deepDiff_differenceExp', data_id)
    exposure_filter = exposure.getFilter().getName()
    exp_src_cat = butler.get('deepDiff_diaSrc', data_id)

    detected_source_positions = SkyCoord(exp_src_cat['coord_ra']*u.deg,
                                         exp_src_cat['coord_dec']*u.deg)
    (idx, sep2d, sep3d) = bright_star.match_to_catalog_sky(detected_source_positions)

    if sep2d.arcsec > 1.0:
        print('No match for visit '+str(visit))

    else:
        ts = calc_visit_mjd(exposure)

        flux = exp_src_cat.getPsfInstFlux()[idx]
        ferr = exp_src_cat.getPsfInstFluxErr()[idx]
        ra = detected_source_positions[idx].ra
        dec = detected_source_positions[idx].dec

        photCalib = exposure.getPhotoCalib()

        phot = photCalib.instFluxToMagnitude(flux, ferr)

        if not np.isnan(phot.value):
            mjds.append(ts)
            mags.append(phot.value)
            merrs.append(phot.error)
            print(mjds[-1], mags[-1], merrs[-1], ra, dec)
        else:
            print('No valid photometry for visit '+str(visit))

lc_data = np.zeros([len(mjds),3])
lc_data[:,0] = mjds
lc_data[:,1] = mags
lc_data[:,2] = merrs
```

Data served by data Butler system

Rubin LSST data products are organized on a per-image basis

Lightcurves must be built by extracting flux data for each object from the source catalog from each image of a set

Modeling lightcurves

Perform a fit to this lightcurve using the pyLIMA software package

```
candEvent = event.Event()
candEvent.name = 'LSST '+str(idx)
candEvent.ra = bright_star.ra.deg
candEvent.dec = bright_star.dec.deg
```

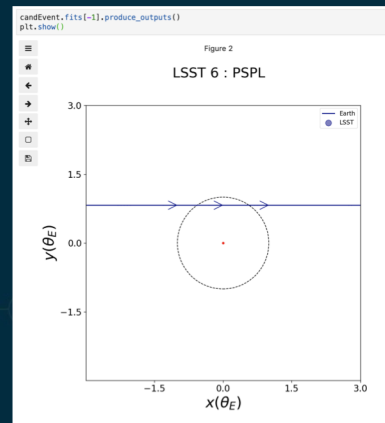

```
tel = telescopes.Telescope(name='LSST', camera_filter=exposure_filter, light_curve_magnitude=lc_data)
```

```
candEvent.telescopes.append(tel)
candEvent.find_survey('LSST')
candEvent.check_event()
```

check_event : Everything looks fine, this event can be fitted

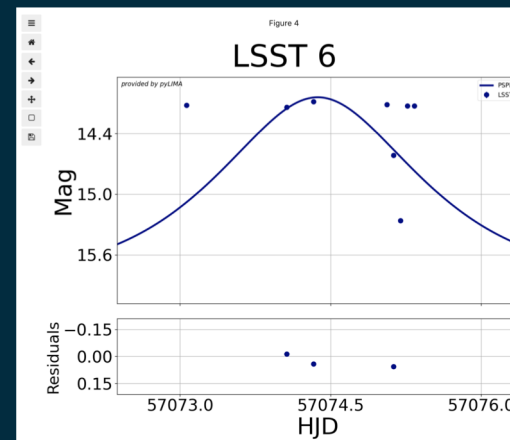

```
model = microlmodels.create_model('PSPL', candEvent)
candEvent.fit(model, 'LM')
```

Start fit on LSST 6, with model PSPL and method LM
 check_event : Everything looks fine, this event can be fitted
 initial_guess : Initial parameters guess SUCCESS
 lmarquardt : Levenberg_marquardt fit SUCCESS
 [57074.37182223308, 0.8243296550731875, 1.000000213749654, 357557.1592597104, -0.886646832413759, 12190961.721315151]
