

# Phase A Weak Lensing: LSST-Euclid Synergy

Joe Zuntz

for Robert Schuhmann and Catherine Heymans

# LSST & Euclid

- PSF 0.7 arcsec
- Mag. lim.  $5\sigma$   $r \sim 27.5$
- Six filters

- PSF 0.06 arcsec
- Mag. lim.  $10\sigma \sim 24.5$
- Single broad filter

- e.g. Rhodes et al (2015), Jain et al (2017)

# Joint Analysis Approaches

1. Combined final lensing catalogs
2. Euclid catalog used as prior for LSST deblending, LSST catalog used for Euclid photo-z
3. Joint pixel analysis, particularly for lensing analyses
  - Simultaneous modelling of the two data sets

# Phase A Paper

- What is the purely statistical gain from a joint-pixel analysis
  - Neglect deblending!
- Since blending will dominate, this sets **minimum improvement** from combining data sets
- Schuhmann, Heymans, & Zuntz  
arXiv 1901.08586

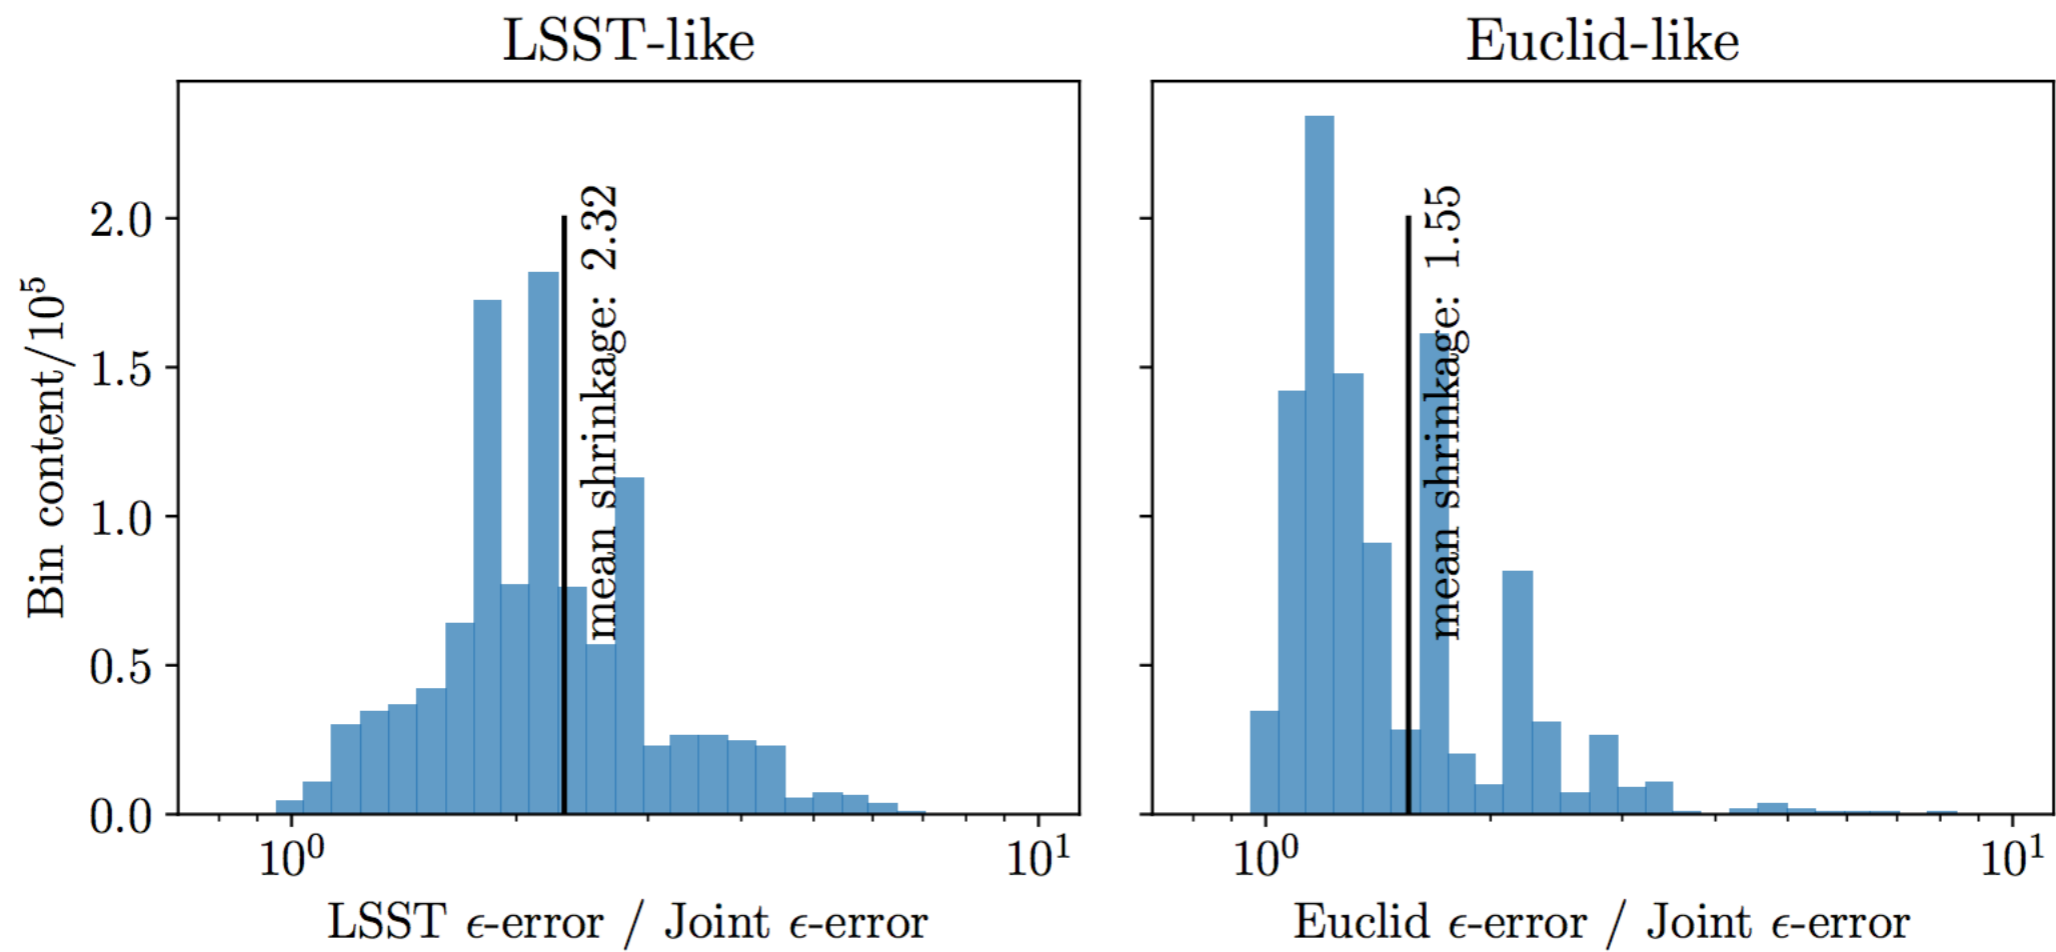

# Error bar improvement single-surveys $\rightarrow$ joint-pixel

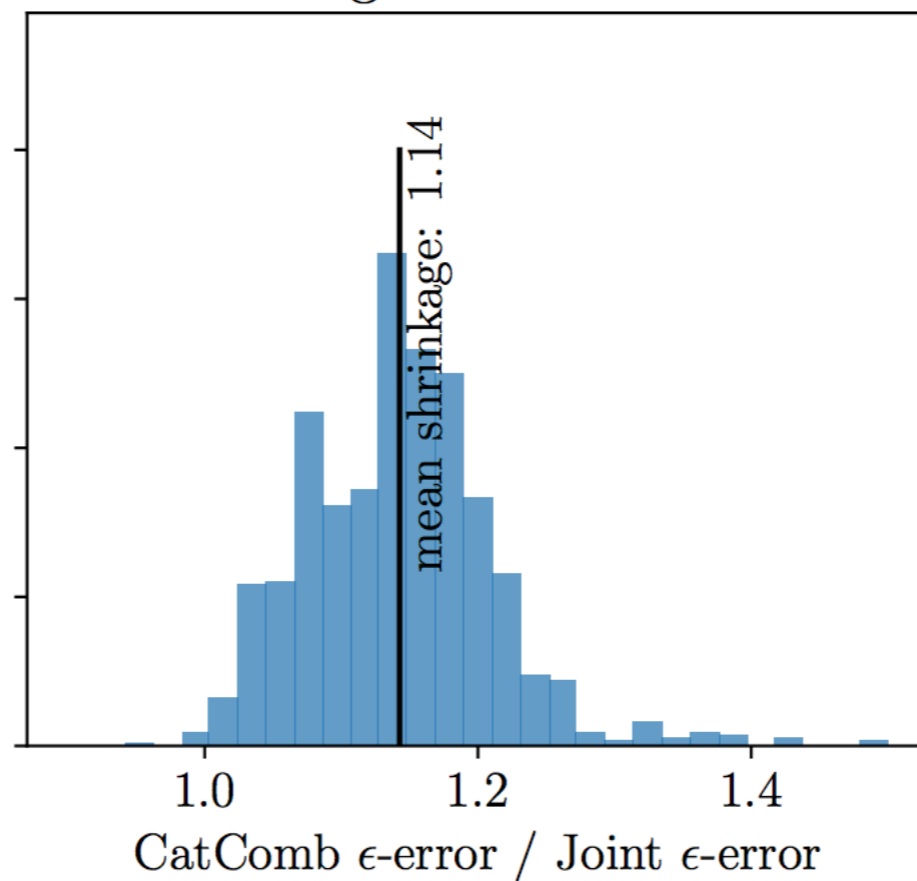

# Error bar improvement catalogue-only → joint-pixel

Catalogue-level combination

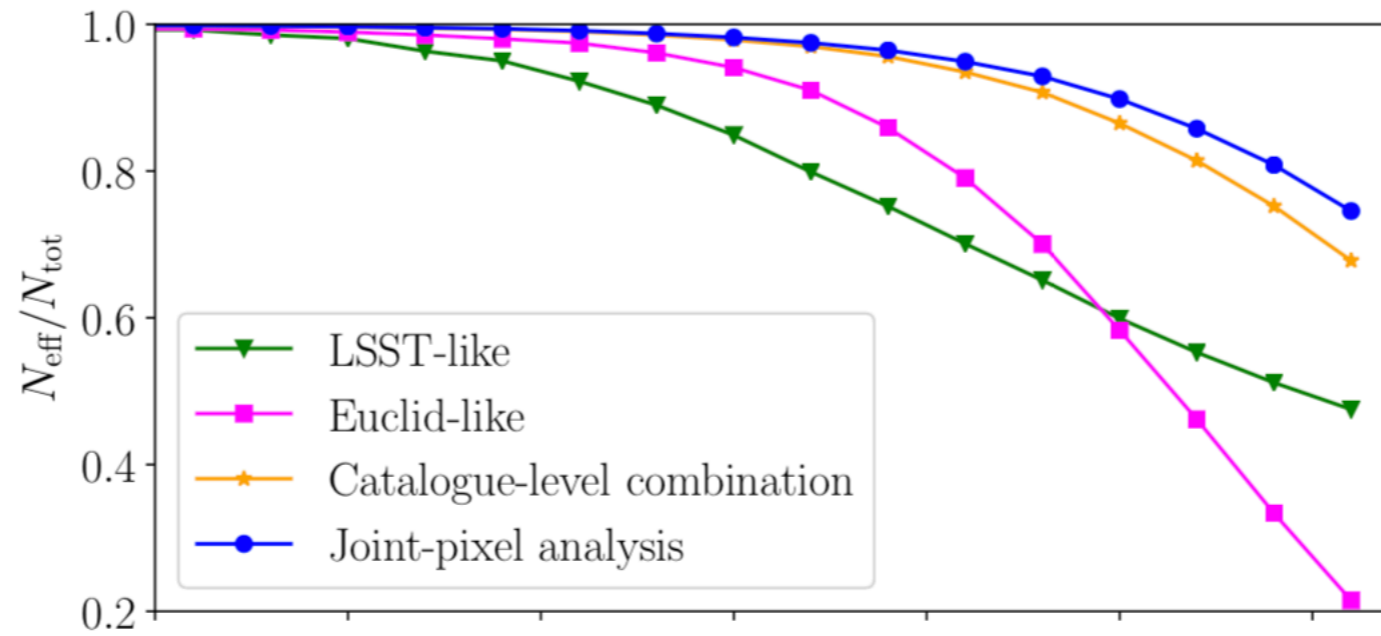

Catalogue combination

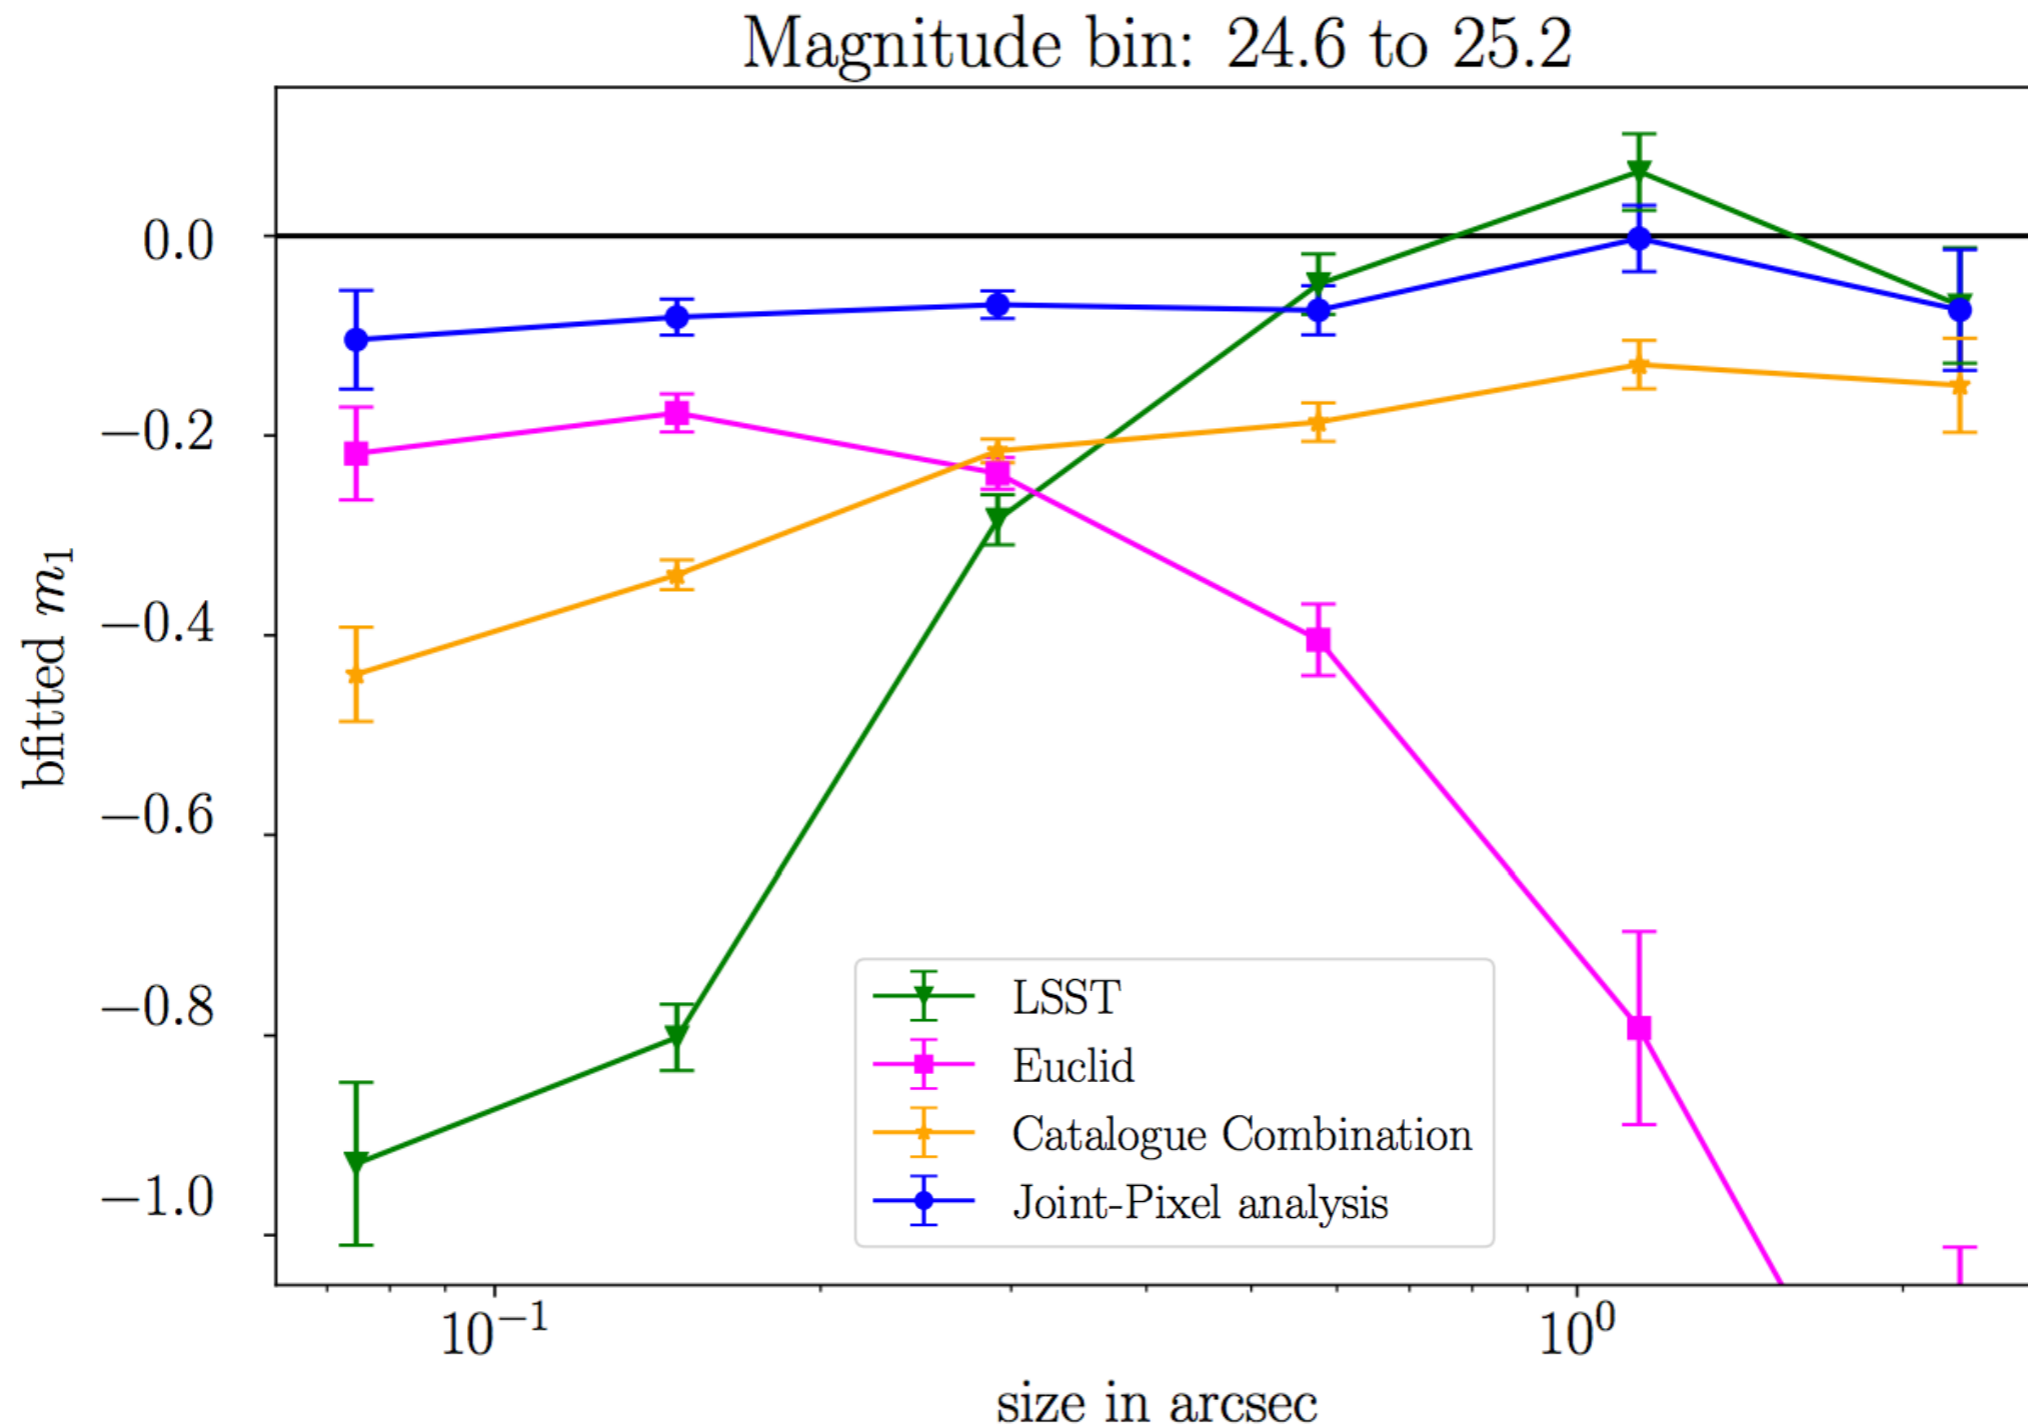

# Number Count Improvement

# Multiplicative Error Calibration Needed

# UK Potential

- UK membership and expertise in both surveys offers unique chance for joint-pixel work
- Political questions complicated
  - DESC-Euclid MOU attempt on hiatus
  - ODF??

# Conclusions

- Joint-pixel analysis is valuable enough \*even\* if errors were only statistical
  - True gain would be much bigger
- Even this toy analysis was hard!  
Real combination very challenging.
  - If your science would benefit then discuss it now
