As part of the SOAR telescope preparation for the Astronomical Event Observatory Network (AEON), we report the following supernova classifications. The targets were supplied by the Zwicky Transient Facility (<https://www.ztf.caltech.edu/>; Kulkarni et al. 2018, ATel 11266) data stream processed through the Lasair broker (<http://lasair.roe.ac.uk/>), and by the ATLAS survey, see Tonry et al. (2011, PASP, 123, 58) and Tonry et al. (ATel #[8680](#)). The observations were performed on the night of 15 April 2019 at the 4.1-m SOAR telescope equipped with the Goodman High Throughput Spectrograph using the 400 lines/mm grating, and a slit width of 1 arc second, resulting in a spectral resolution of 0.636 nm. Classifications were done with SNID (Blondin & Tonry, 2007, ApJ, 666, 1024).

Survey Name	IAU Name	RA (J2000)	Dec (J2000)	Disc. Date	Source	Disc Mag	z	Type	Phase
ZTF19aaozsuh	SN2019dde	14:28:12.03	-01:36:15.0	2019-04-09	ZTF	18.11	0.057	IIn	at max
ATLAS19gde	SN2019dgh	13:45:28.42	-06:01:48.7	2019-04-09	ATLAS	19.532	0.077	Ia	at max

Subjects: Optical, Supernovae

 Tweet

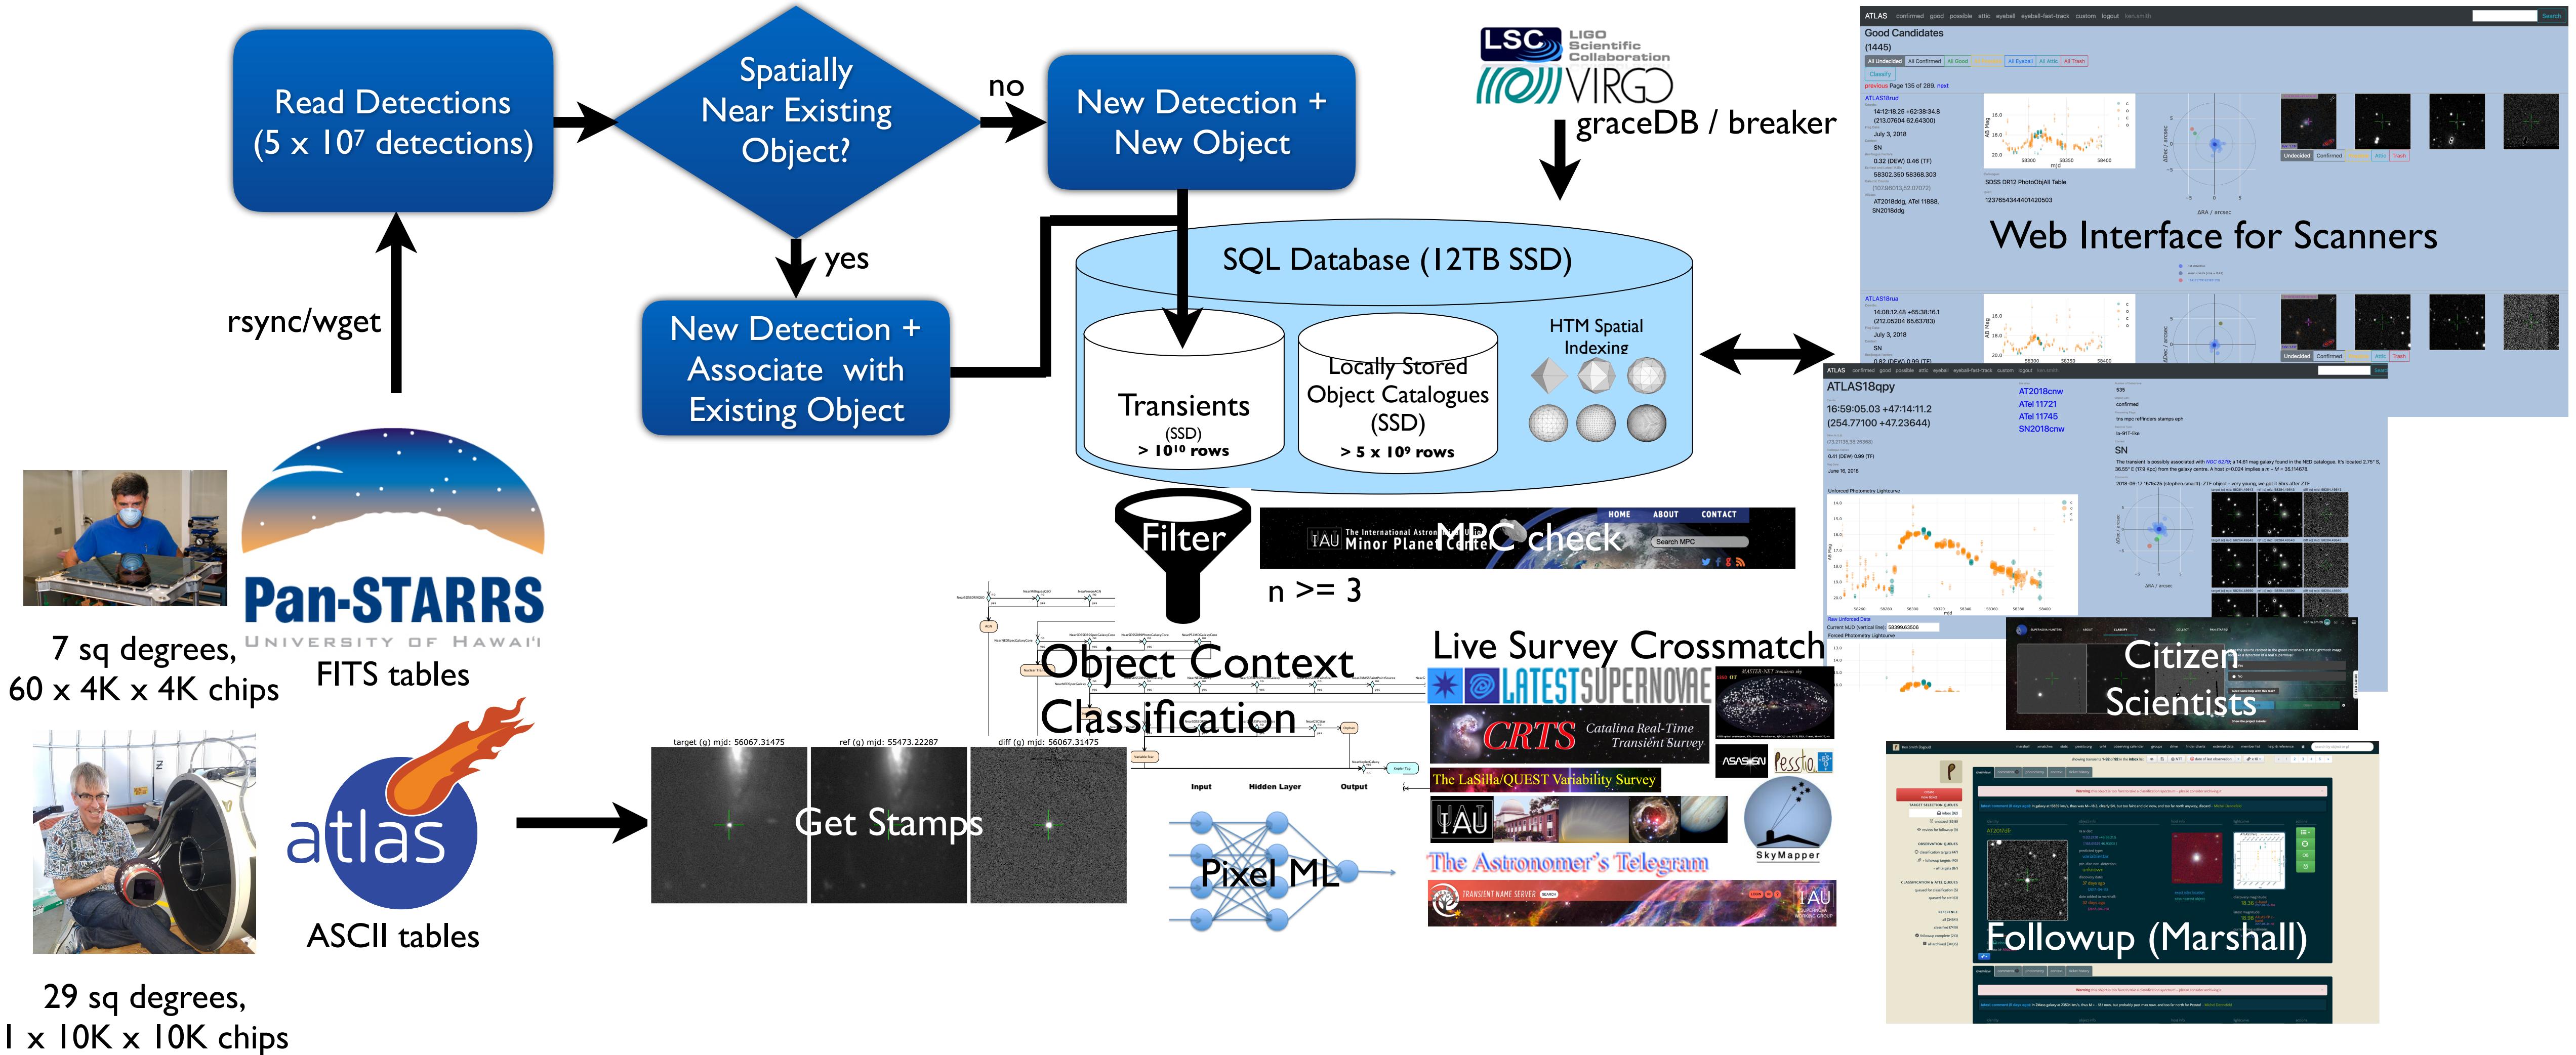

The Fast and Dark Side of Transients experiment (FDST; ATel #[12362](#)) reports the spectroscopic observation of [SN 2019dpu](#). The target was supplied by the Zwicky Transient Facility (<https://www.ztf.caltech.edu/>; Kulkarni et al. 2018, ATel 11266) and processed through the Lasair broker ([Smith, Williams, et al. 2019, RNAAS, 3, 26](#); [https://lasair.roe.ac.uk/](http://lasair.roe.ac.uk/)). Classifications were done with SNID (Blondin & Tonry, 2007, ApJ, 666, 1024).

The observations were performed on 2019-04-22 using SPRAT (Piascik et al 2014) on the Liverpool Telescope (Steele et al. 2004).

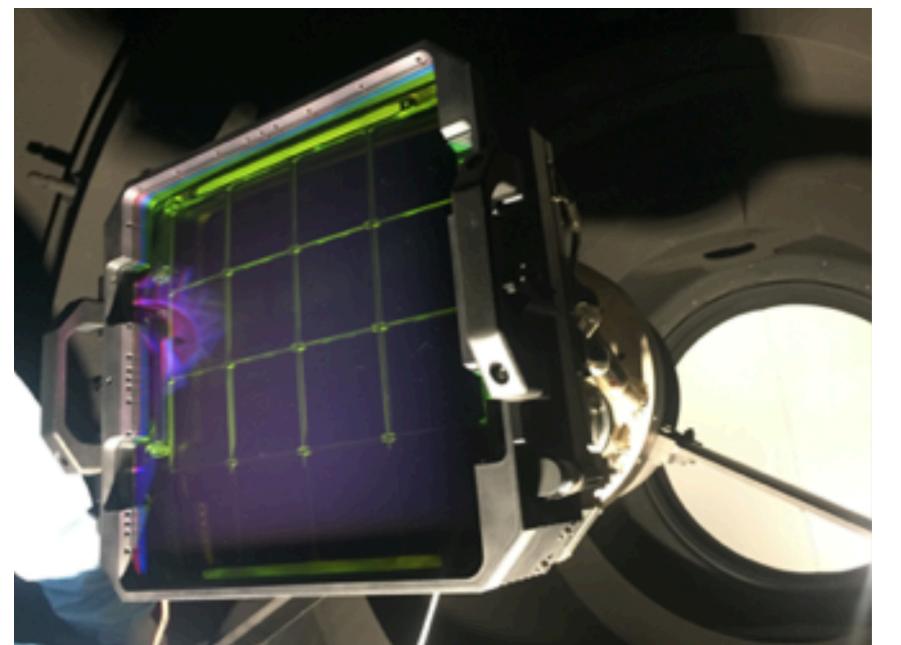

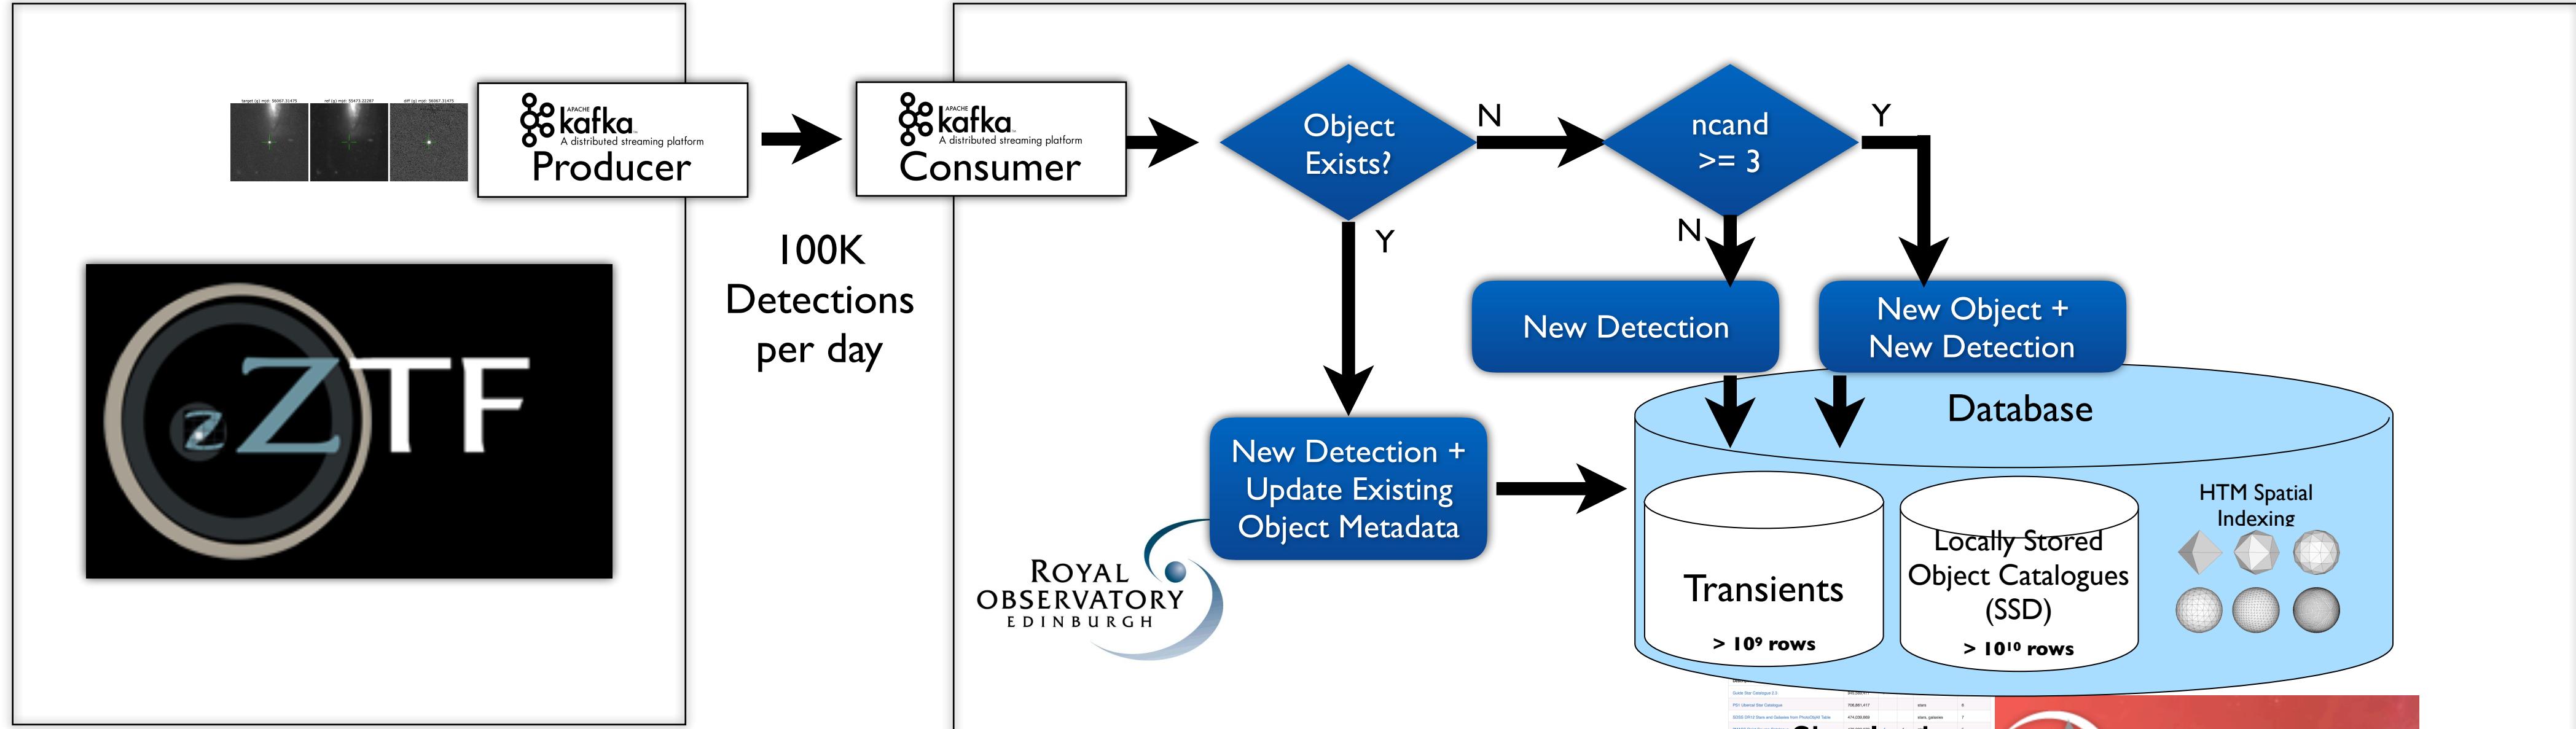

Survey Name	IAU Name	RA (J2000)	Dec (J2000)	Disc. Date	Source	Disc Mag	z	Type	Phase
ZTF2019aaqcqkv	SN2019dpu	13:04:18.4	+33:28:15.7	2019-04-12	ZTF	20.5	0.075	Ia	

(1) The redshift is obtained from the SNID fit. The phase obtained from SNID is -7 days.

[Tweet](#) [Recommend 2](#)

During the ongoing All Sky Automated Survey for SuperNovae (ASASSN), using data from the quadruple 14-cm "Brutus" telescope in Haleakalā, the 1.3-m "Leavitt" telescope in Fort Davis, Texas, the quadruple 14-cm "Pillbox" telescope in Sutherland, South Africa, and the quadruple 14-cm "Cassius" and "Tololo" telescopes in Tololo, Chile, we discovered several new transient sources. Properties and associated finding charts showing the archival imaging (left) and the spectra (right) are included in the table below:

Cone Search

Enter RA and Dec and optionally radius in arcseconds, to search for objects in ZTF in that cone. They can be separated by spaces, commas, semicolons, or vertical bars. They can be in decimal degrees (floating point number), or sexagesimal in the form hh:mm:ss and dd:mm:ss or hh mm ss and dd mm ss. You can also enter an objectId, beginning with 'ZTF'.

RA Dec radius:

Search Module Parameters

- *angular separation crossmatch radius*
- *physical separation crossmatch radius*
- *source magnitude filtering*
- *magnitude dependent search radii for bright stars and galaxies*

Classifications & Reliabilities

- *transient given a predicted classification based on the parameters of the catalogued source it matches against*
- *transients can be given multiple classifications which are later ranked*
- *a transient can either be **synonymous** with (within 0.5”), **associated** with (>0.5” away) or **annotated** by a catalogued source*

Search Algorithms are written in
YAML - plain text

Object ZTF19aabyuzq

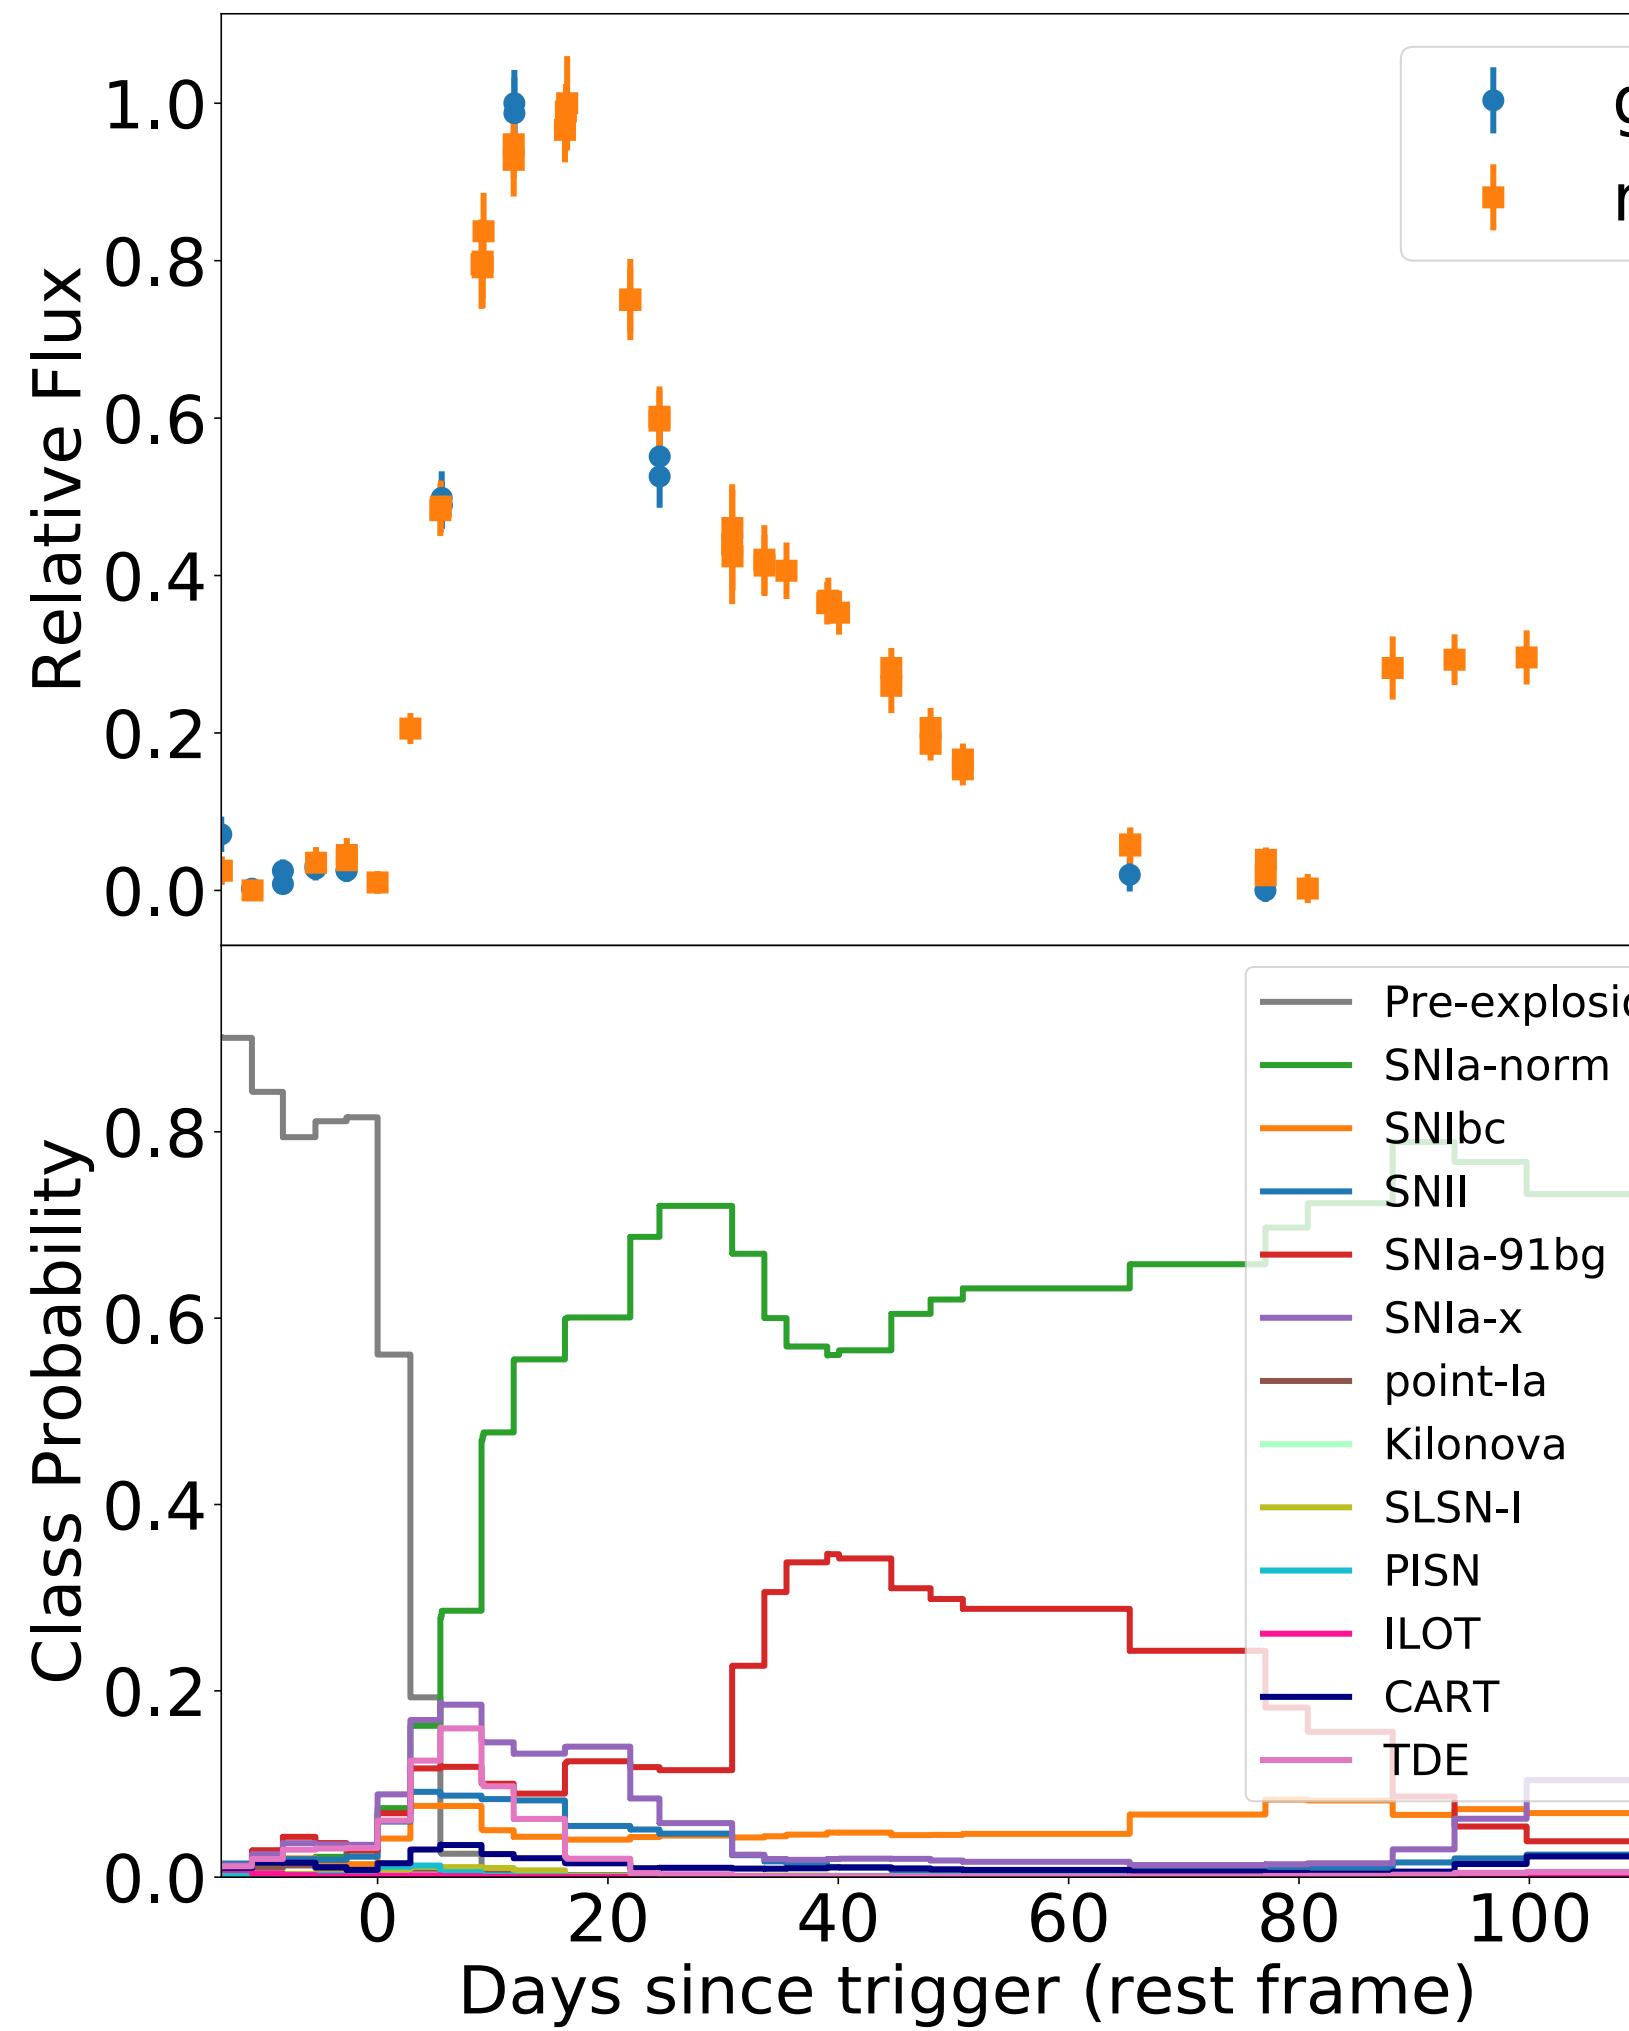

- Object has 22 candidates, at mean position:
 - (RA, Dec) = (190.407813, 48.268959)
 - (RA, Dec) = (12:41:37.875, 48:16:8.254)
 - (l, b) = (127 442522.68 773.313)
- Classified as SN at distance 2.05 arcsec.
- The transient is possibly associated with [SDSS J124137.68+481608.0](#); an r=18.88 mag galaxy found in the SDSS DR12 PhotoObjAll Table catalogue. It's located 0.31 N, 2.03 E (3.9 Kpc) from the galaxy centre. A host photoZ=0.104 (± 0.040) implies a transient $M = -18.59$.
- Information on this webpage also [available as JSON](#).
- Conesearch Links (at 5 arcsec): | [Simbad](#) | [NED](#) | [Transient Name Server](#)

Active CVs	Roy Williams	Cataclysmic variables with wide swings in magnitude	SELECT objectId, ncand, maggmean, magrmean FROM objects WHERE (magmax - magmin > 2.0B) OR (magmax - magmin > 2)

Lasair Watchlists

Lasair Watchlists

Logged in as ken ([Logout](#))

A watchlist is a set of points in the sky, together with a radius in arcseconds. It is assumed to be a list of "interesting" sources, so that any transient that falls within the radius of one of the sources might indicate activity of that source. Each user of the Lasair system has their own set of watchlists, and can be alerted when a ZTF transient is coincident with a watchlist source.

You can create a watchlist of sources by preparing a text file, where each comma-separated line has an identifier for the source, then the RA and Dec in decimal degrees. One way to do this is with [Vizier](#) and a spreadsheet program such as Excel or Numbers. Here is [an example of the CSV data](#). The 42 entries are *BL Lac candidates for TeV observations* (Massaro+, 2013)

An "Active" watchlist is one that is compared immediately when new ZTF candidates are ingested, with an alert sent immediately to the owner of the watchlist. (This feature is not yet implemented).

[Create new watchlist](#)

Up to several thousand objects per list (at the moment)

My Watchlists

Your private watchlists are listed below. Click "Create new watchlist" above to make a new one. Click on the name of the watchlist for more information and crossmatching.

Lasair UK Workshop

October 2018: Resulting Requirements

Near term requirements

LIGO - Virgo object tagging for O3 (starting soon!)

APIs (e.g.TAP service for querying Lasair)

User defined alert mechanism (e.g. SMS)

Jupyter:

Make Jupyter available to all users - with "Overviews", "How-tos", "Getting started" pages

Provide standard queries for Jupyter notebooks

Allow private areas/folders and the ability to define groups within the Jupyter hub

Have ability for Jupyter notebooks to run automatically.

Longer term requirements

Provide a mechanism for allowing lightcurve analysis code to be uploaded

Vizier integration to allow spectra of objects in watch list to be pulled

Model and empirical lightcurve fitting

Lightcurve mashing from user-provided and other surveys

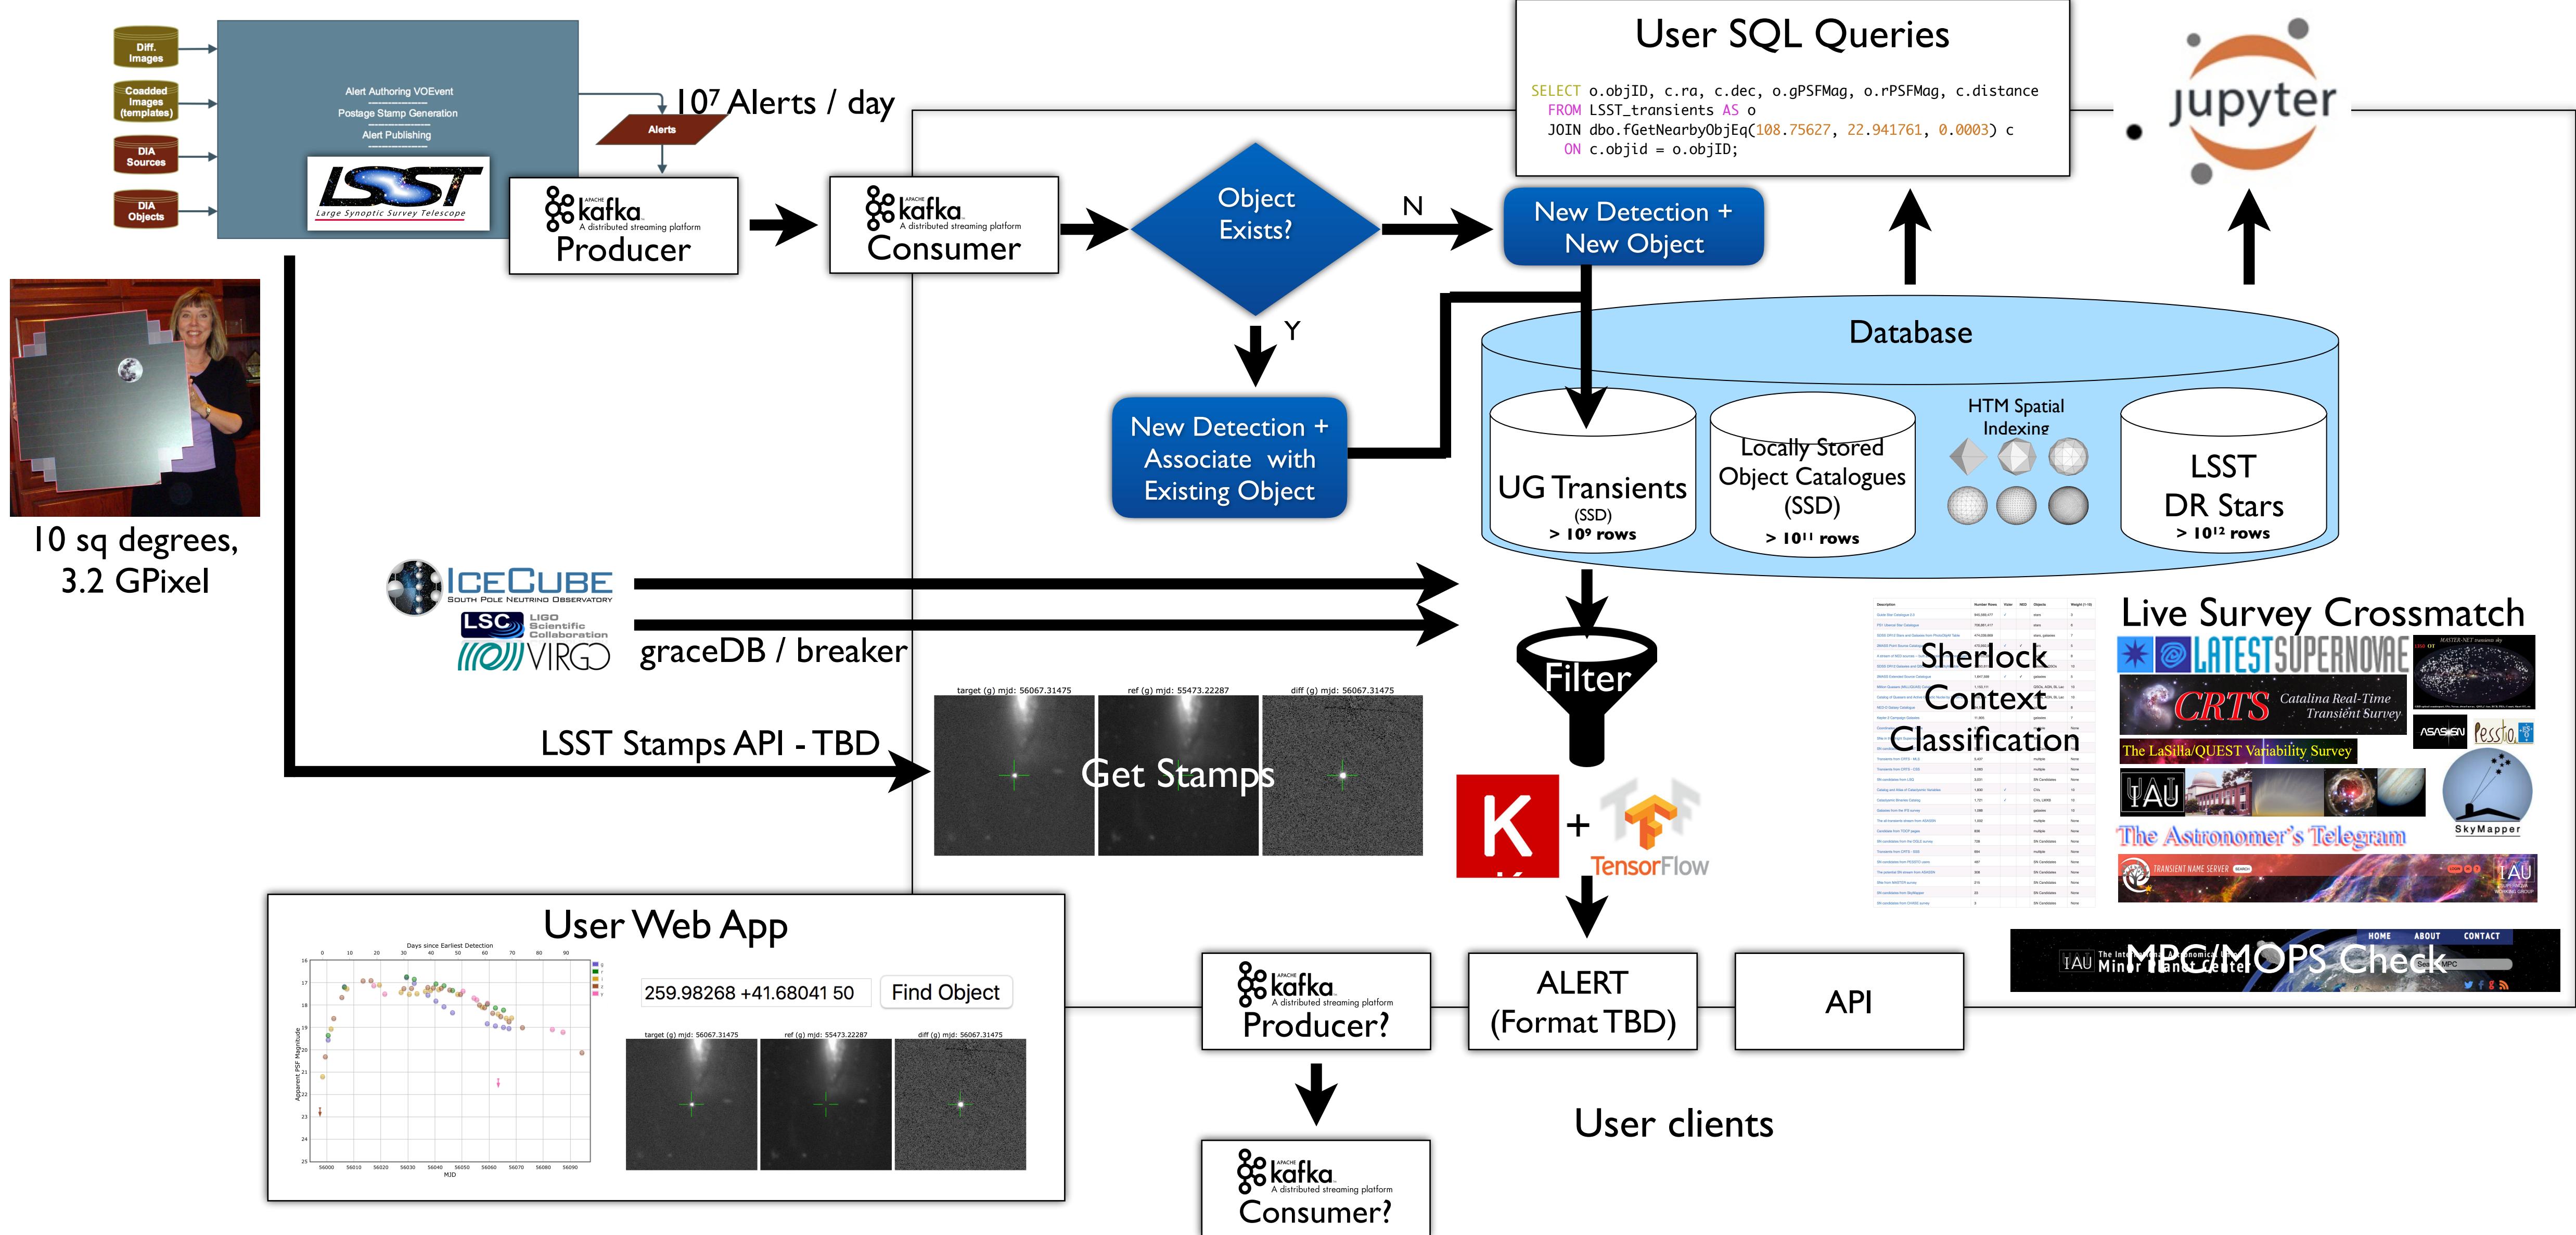

Integrate VISTA and or UKIDSS stamps

EUCLID: optical and NIR images, high-resolution stamps of transient location

HST and Spitzer overlap. Provide postage stamp of the pre-discovery position

Store transmission characteristics of filters for mapping lightcurves

Lasair + LSST

Lasair Next Steps

Submit formal Letter of Intent to be an LSST broker (May 15th)

Very large UK compute resource (IRIS) - hardware guaranteed (est 0.5 EB storage by end of survey and millions of hours/year CPU resource)

Certainly large enough to hold the estimated 2.2PB of alert data
(<https://dmtn-102.lsst.io/DMTN-102.pdf>)

Lasair part of the overall U.K. plan for a full data access centre (DAC) with value added software and other data sets (Gaia, VISTA, UKIDSS)

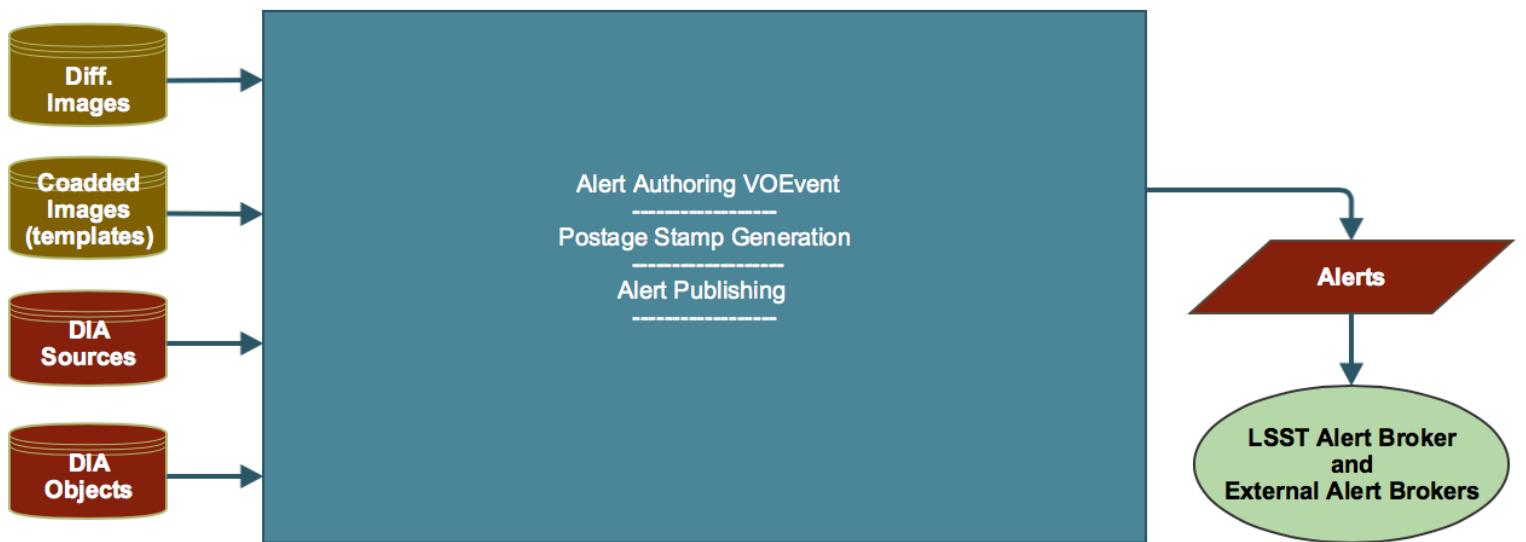

Deploy Lasair onto the new IRIS petascale platform and scale up from ZTF to LSST, including database replication

Continue (in parallel) to explore no SQL technologies (e.g. foundationDB, Cassandra) and big data stacks (e.g. SMACK)

LSST Alert format example

```

https://github.com/lsst-sims/sims_alertsim

Lasair Next Steps

Lightcurves – present assimilated diaSource alerts in diaObjects: providing interactive webpages (linked to database), plots, ability to select ranges, submit user added points.
Previous history from Pan-STARRS, DES, Skymapper, ATLAS, CRTS, PTF/ZTF

Postage stamps (if available) – all LSST detections and most recent non-detections.
Plus multi-colour images from LSST, near infra-red (VISTA/UKIDSS), H-alpha (VPHAS)
and EUCLID, or HST/JWST if space based imaging is available.

Massive catalogue cross-match - with star, galaxy, AGN, x-ray, radio catalogues and provide enhanced classification (e.g. integrating machine learning) via "Sherlock"

Probabilistically classify all transients as: supernova – kilonova – GRB – Tidal Disruption Event – AGN – XRB – CV – eruption star – microlens – orphan (e.g. use of first 24-48hrs lightcurve - rapid rise/decline?)

Lasair Next Steps

In real-time, cross-match to all other wavelength time-domain surveys : gamma-ray, x-ray and radio (e.g. MEERKat/Thunderkat through 4pisky.org, Swift, SVOM, eRosita)

Cross match to all previously known transients: supernovae, transients, gamma ray-bursts, x-ray and radio burst sources (e.g. searching for currently unknown physical links over the time dimension)

Provide absolute mags when likely host spectroscopic (or photoZ) information is available

Multi-messenger cross-matching: 4D coincidence tag for LIGO/Virgo + IceCube

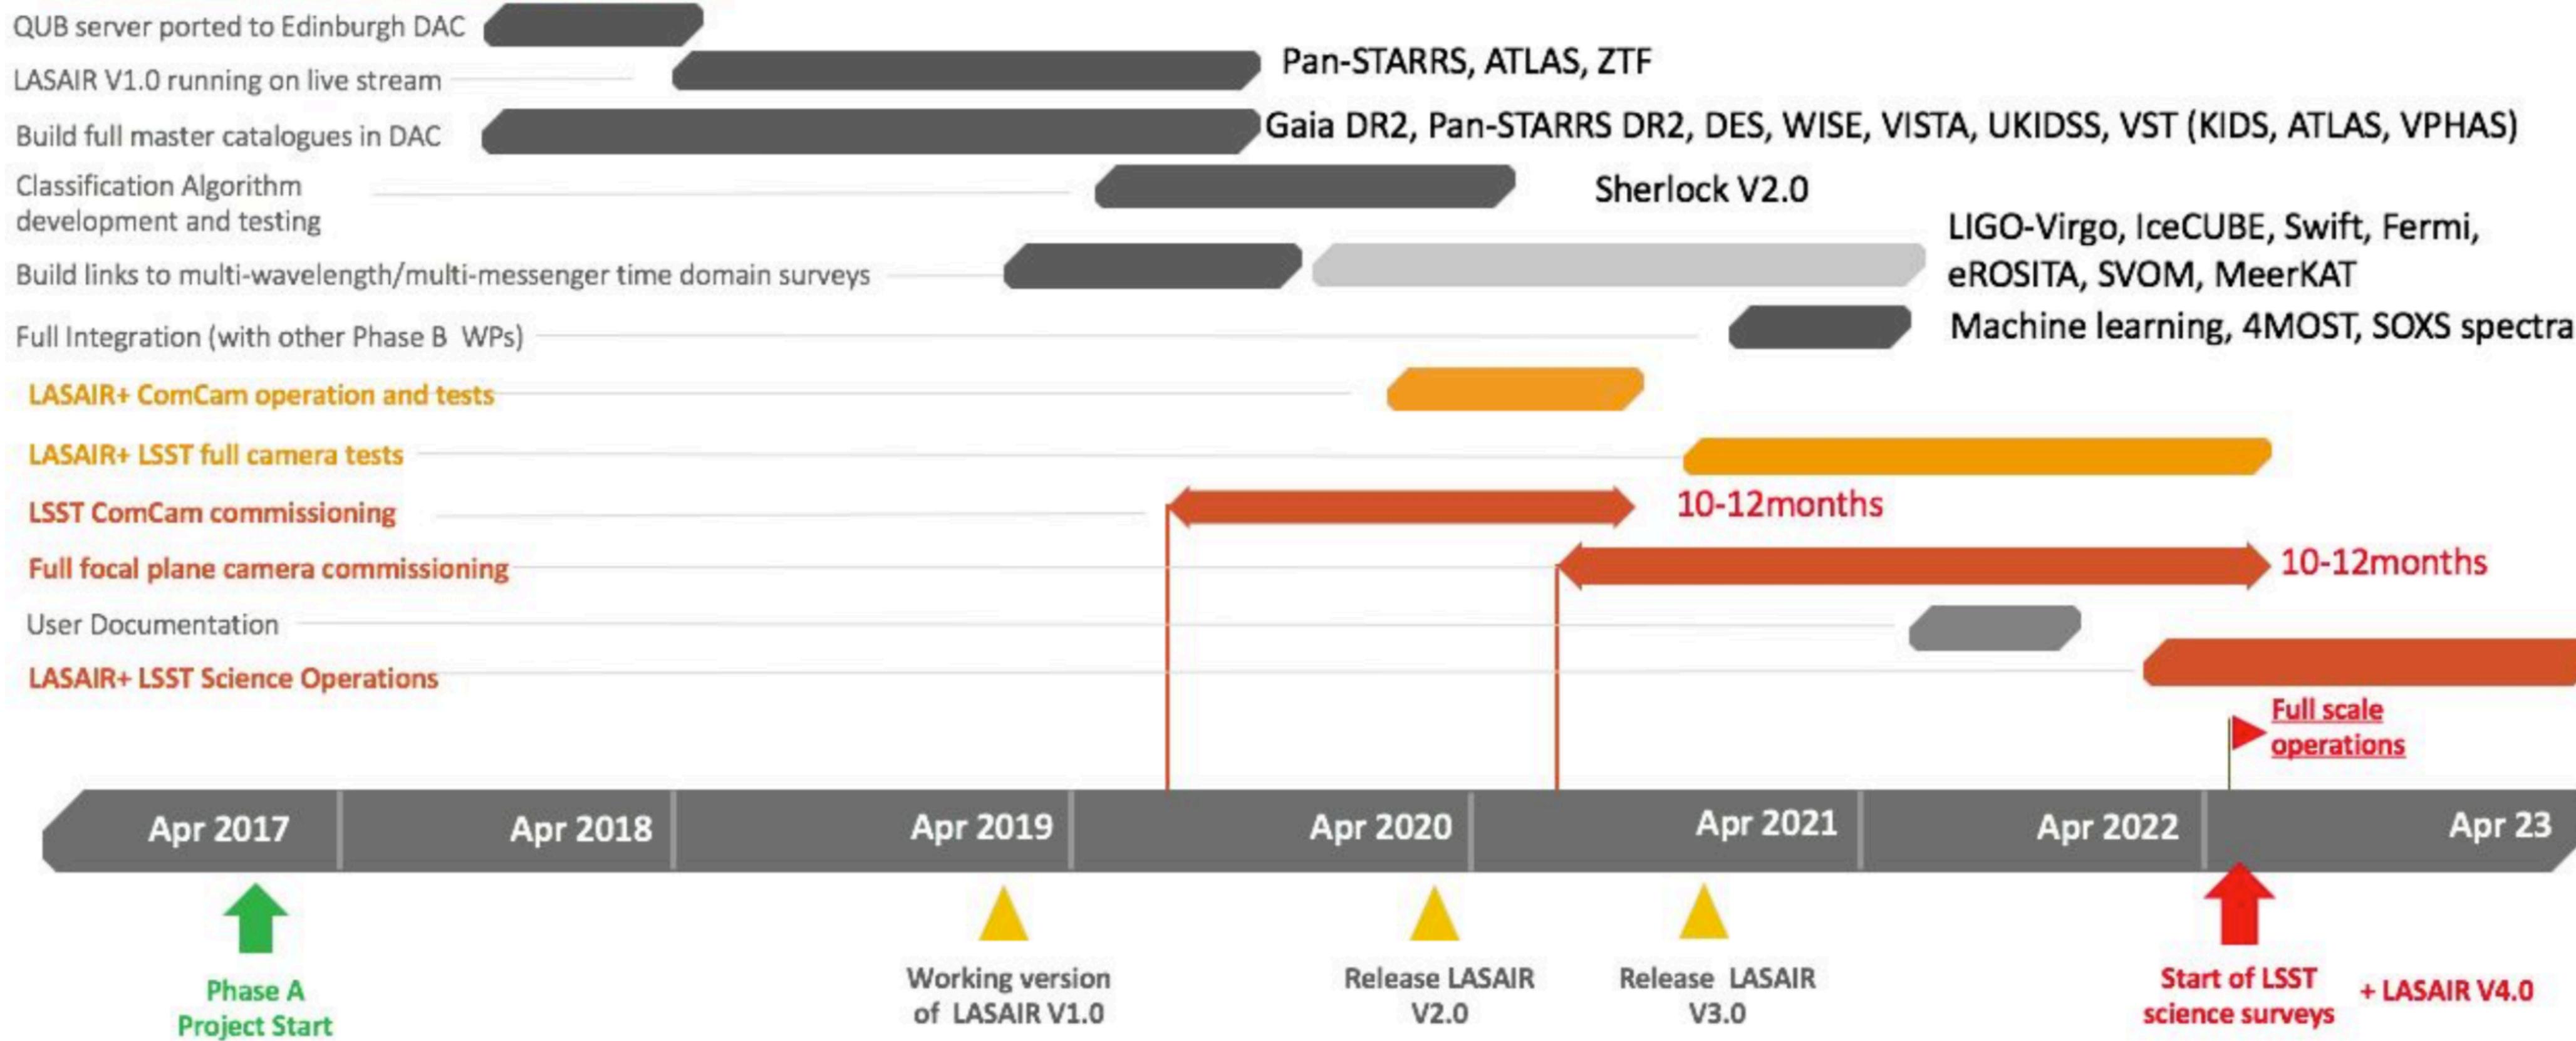

TOM outgest - especially 4MOST and SOXS

Lasair Current Plan

Real-time processing of an alert stream and full functional user interaction – Pan-STARRS and ATLAS
Fully functional database with 10^9 rows, real-time access and interaction updates by users
Build 1st Generation master catalogue of all-sky sources : USNO, GSC, SDSS, NED, Veron, Milliquas, CVs, MPC
Context and cross-matching classification code : *Sherlock V1.0*
Machine learning code operational for real-bogus classification
Link fully functional database to a public announcement stream
Hardware specifications for upscale to LSST data rates

Work complete to date (Nov 2017)

Lasair is being used

(39 ATels - including ePESSTO as of April 25 2019)

SOAR telescope spectroscopic classification of optical transients

ATel #12508; *R. Cartier (CTIO), G. Terreran, R. Margu (CTIO)*

on 16 Feb 2019; 20:07 UT

Distributed as an Instant Email Notice
Credential Certification: Regis Cartier (rgc)

Subjects: Optical, Supernovae

We report the following supernova classifications. The targets were found by the Zwicky Transient Facility (<https://www.ztf.caltech.edu/>; Kulkarni et al. 2018, ATel #11266), through the Lasair broker (<http://lasair.roe.ac.uk/>), the ESA C

and DPAC (<http://gsaweb.ast.cam.ac.uk/alerts>), and by the A

PASP, 123, 58) and Tonry et al. (ATel #8680). The observation

Subjects: Optical, Supernovae, Transient

February 13 at the 4.1-m SOAR Telescope equipped w

Spectrograph using the 400 lines/mm grating, and a slit wi

The Fast and Dark Side of Transients experiment (FDST; ATel #12362) reports the spectroscopic spectral coverage from 380 nm to 775 nm with a resolution of 1. Targets were supplied by the Zwicky Transient Facility SNID (Blondin & Tonry, 2007, ApJ, 666, 1024) and Gelato (<https://www.ztf.caltech.edu/>; Kulkarni et al. 2018, ATel 11266) and processed through the Lasair broker (<http://lasair.roe.ac.uk/>). Classifications were done with SNID (Blondin & Tonry, 2007, ApJ 666, 1024).

The observations were performed on 2019-02-13 using SPRAT (Piascik et al 2014) on the Liverpool

Lasair Summary

First prototype version is running. See <https://lasair.roe.ac.uk>

User created queries always welcomed
